Two Vital Perspectives The following article is contributed by two writers, a chiropractor and a naturopath. Each offers a unique and vitalistic perspective.

The germ theory states that diseases are due to specific microorganisms, which are capable of transmission from body to body. Yet although it is widely accepted by medical professionals, forming the basis for billions of dollars of healthcare spending (actually sickness care, but that’s another article), the fact that so many people believe it to be true doesn’t make it so. This is one of the classic logical fallacies: argumentum ad populum, the appeal to the majority, where a thing is stated to be true simply because so many people believe it.

That didn’t work for the belief that the earth was flat, and it shouldn’t work for a theory of disease that is increasingly coming under fire from the scientific community and whose fundamental premise was known to be flawed almost from the beginning. I am reminded of the famous quote by Anatole France: “If fifty million people say a foolish thing, it is still a foolish thing.”
The Germ Theory: A Chiropractic Look at the Germ Theory

Dr. Daniel Middleton is a 1991 graduate of Sherman College of Straight Chiropractic and has publications. Read about him here: adjustingroom.com.

About the Author:

"c'est le terrain qui est tout." ("Bernard was right. The seed is nothing, the soil is everything.

Everyone is familiar with Pasteur's name, but one of his contemporaries and chief opponents with revenues exceeding $3 billion are often called) has based its fundamental premise on a theory that even its most well-known proponent—as Pasteur arguably was—recanted in the end. For the past one hundred years, modern medicine has pursued a theory that is, at best,...
