Keeping Our Babies Safe

Although I would love to, it's not possible to make our kids safe on our journey. When I started, the things like bedding, towels, and baby clothes were also based on the weight. Now, I was almost done. I had to read the same old.

Most forward facing child seats have an upper weight limit of 40 pounds. Some seats have a weight limit of 65 pounds. A belt-positioning booster seat should be used if your child weighs approximately 40 to 65 pounds.

Always use the correct harness for your child's weight and height. Check the manufacturer's instructions for the correct harness and weight limit. The harness should be used in the vehicle or on other vehicles and trailers for your child.

Historical link to safety seats in cars and the history of child car seats. This is a link to a historical document from the National Highway Traffic Safety Administration (NHTSA) regarding child car seat safety. The document discusses the evolution of child car seat standards and the importance of proper installation and use. It also mentions the National Child Car Seat Safety Council and the American Automobile Association (AAA). The link is: [Historical link to safety seats in cars and the history of child car seats](#)
